AUTHOR: Belyayev, V. I.; Vyal'tsev, V. V.; Pavlova, I. S.ORG: Marine Hydrophysics Institute (Morskoy gidrofizicheskiy institut)TITLE: An experiment of weather modification by seeding of fog with dry ice

SOURCE: AN SSSR. Izvestiya. Fizika atmosfery i okeana, v. 2, no. 6, 1966, 630-635

TOPIC TAGS: weather modification, fog, atmospheric temperature gradient

ABSTRACT: The weather modification by fog seeding from an aeroplane on Jan 12 1961 in the district of Nal'chik is described and analyzed. The city, district, and the northern Caucasus were surrounded by uniform meteorologic conditions and the fog was defined as a type lasting usually to the afternoon and sometimes for several days. The wind direction and velocity were defined by circular seeding. Clearing over city and airport were achieved by seeding in and against the wind direction, and the resulting clearing was supported by additional approaches from the wind-exposed direction. Temperatures at ground level increased during the experiment from -4.6 C at 8.35 a.m. to 3 C at 1 p.m. The contribution of the seeding experiment to the atmospheric radiation balance and temperature increase was analyzed. The heat ΔQ , entering the lower atmosphere due to the clearing, was estimated as $5.3 \cdot 10^{13}$ cal.

Title : Introduction of Hexachloran into the Soil -- an Economical Method of Controlling the Phytomonas.

Orig Pub : Zashchita rast. ot vredit. i bolezney, 1957, No 1, 18-19.

Abstract : A mixture of 40 kg HCCH with 300 kg of superphosphate (S) per one hectare was administered in one field with a fertilizer sowing machine. Another field (also of three-year lucerne equally infected with phytomonas) was dusted with HCCH, while S was administered separately. In six weeks 13% plants were infected with insects on the first field and the larvae per stem were 0.14% on the average; on the second field the infected plants were 73.4% of all the plants and there were 0.93% larvae per stem. The average height of the stems on the first field was 61.4 sm

Card 1/2

USSR/General and Special Zoology - Insects.

P.

Abs Jour : Ref Zhur - Biol., No 7, 1958, 30596

and the weight of the stems was 715 g; on the second field the average height was 47.6 sm and the weight of the stems was 431 g. In general, the economy (in labor and material) resulting from the simultaneous introduction into the soil of HCCH and S was 37 rubles / one g.

TITLE: Mechanical properties of a glass plastic at room temperature

PERIODICAL: Inzhenernyy zhurnal, v.2, no.4, 1962, 330-336

TEXT: Some results are available on the behaviour of these plastics in bending, but not in pure compression-tension. The present experiments were carried out on the glass plastic CT9P -1-30 (STER-1-30), made from satin and epoxy-phenol resin. Values are reported for the basic strength characteristics in tension: Young's modulus, Poisson's ratio, proportional limit, ultimate strength, and extension at break. The methods of preparing and testing the specimens are described, and stress-strain curves are given for specimens of various orientations. The variability of the different strength properties is tabulated. The theoretical change of properties with orientation is calculated on the assumption that the material is orthotropic, and reasonable agreement is obtained between calculated and measured values. Strain-time curves are reproduced for specimens of

Card 1/2

Mechanical properties of a glass ...

S/258/62/002/004/014/019
E081/E135

different orientations, and the creep curves fitted by an equation of the form

$$\epsilon = Bt^k$$

where ϵ is the creep strain, t is time, and B and k are constants. Values of k for different orientations vary between 0.3 and 0.36. The recovery curves are also given and fitted by an equation of the form

$$\epsilon = \epsilon_0(1 + \lambda t^p)$$

Mean values of λ and p are 0.13 and 0.15 respectively.
There are 9 figures and 2 tables.

TOPIC TAGS: Hall effect, metal film, mercury ^{compound}, zinc plating,
selenide, Hall transmitter

ABSTRACT: Experimental samples of mercury selenide Hall film transmitters were prepared by the vacuum process method without interruption of the vacuum during the operation. The study showed that it is advisable to make the contacts of zinc. The stability of the transmitters with zinc contacts is higher than with contacts made of silver paste. Moreover, the contacts were not previously (before the paste was applied) exposed to air. A table giving the basic parameters of HgSe transmitters and their various characteristics is also included.

TITLE: Investigation of a Hall generator whose area is partly penetrated by magnetic flux

SOURCE: Tallin, Politekhnicheskiy institut, Trudy, Seriya A, no. 220, 1965, Trudy po elektrotekhnike i avtomatiko (Works on electrical engineering and automation)
Sbornik statej, no. 3, 49-53

TOPIC TAGS: Hall generator, Hall effect

ABSTRACT: The results are briefly reported of an experimental investigation of a HgSe-film Hall generator whose area was partly penetrated by a concentrated magnetic flux. A large-area Hall plate was placed between a changeable-pole-piece electromagnet; the plate could be moved along both coordinate axes. A very high sensitivity of the generator in the area between the Hall-voltage electrodes was discovered. This sensitivity did not change when the Hall-voltage and control-current electrodes were exchanged. Curves of the Hall voltage vs. magnetic-flux position and its width are shown, as is a pattern of equipotential lines between the electrodes. Orig. art. has: 5 figures and 1 formula. [03]

TITLE: Diamond-like semiconductors in the vitreous state

15

SOURCE: Fizika tverdogo tela, v. 7, no. 7, 1965, 2266-2268

B

TOPIC TAGS: electric conductivity, temperature dependence, activation energy, forbidden zone width, glass product, semiconductor

ABSTRACT: In view of the fact that an early investigation (DAN SSSR v. 160, 633, 1965) has shown unexpectedly that some ternary semiconductors components of the $A^{11}B^{IV}C^{2V}$ type ($CdGeAs_2$ and $CdGeP_2$) are produced in the vitreous state, the authors investigated further the glassy structure of $CdGeAs_2$. In the crystalline state this compound is highly homogeneous and has the structure of chalcopyrite. The radial distribution of the electron density was calculated from x-ray structure measurements and compared with that for the atoms in the crystal within the first and second coordination spheres. The results show that the short-range order in the glass is similar to that in the crystal structure. The vitreous $CdGeAs_2$ has p-type conductivity with an electric resistivity $10^{-6} \text{ ohm}^{-1}\text{cm}^{-1}$ at room temperature. Unlike previously investigated semiconductor glasses, this substance does not have a region of intrinsic conductivity in the 80--670K interval. In the

15

Card 1/2

L 20972-66

ACCESSION NR: AP5017348

3

80--200K range the conductivity remains practically constant, but above 200K it increases exponentially. The width of the forbidden band is approximately the same as for the crystalline sample, ~0.6 ev at 295K. It is concluded that only impurity conductivity obtains in the samples up to 670K, and that the activation energy of the impurity level is ~0.55 ev. "The authors thank T. N. Mamontova and G. I. Stepanov for determining the width of the forbidden band." Orig. art. has: 2 figures and 1 formula.

TITLE: A device for dipole moment measurements IDM-2

SOURCE: Zavodskaya laboratoriya, v. 30, no. 4, 1964, 500-501

TOPIC TAGS: dipole moment, dielectric constant, measuring device IDM 2, beat frequency method, dimethylformamide, chlorobenzene, phenylhydrazone acetaldehyde

ABSTRACT: An IDM-2 device for determining the dipole moment of molecules is described. The dielectric constant of a dilute solution in a nonpolar solvent is measured in a specially constructed capacitor which consists of two concentric glass cylinders between which the investigated solution is poured. The capacitor plates are ordinary foil wrapped around the outside of the larger cylinder and the inside of the smaller. Hence the special capacitor C_s is a series combination of two capacitors: one formed by the glass cylinders C_c and the other by the filled gap $C_p = \epsilon C_o$, where C_o is the capacitance of the empty gap. The special capacitor is placed in parallel with a precision variable capacitor. The resultant capaci-

Card 1/3

ACCESSION NR: AP4033621

tance controls the output frequency f_1 of a signal generator. The frequency f_1 is mixed with a constant frequency f_0 stabilized by a quartz resonator, which produces a beat frequency $f_1 - f_0$. The variable capacitor is adjusted until the beat frequency is zero. If the capacitance of the special capacitor C_{s1} with a known control solution and C_{sx} with the investigated solution, the difference of the two is the same as the difference ΔC required in the variable capacitor to produce zero beat frequency for the two cases. Then the dielectric constant of the investigated solution is given by

$$\epsilon_x = \frac{C_c(C_{s1} + \Delta C)}{C_c(C_c - (C_{s1} + \Delta C))}$$

The temperature of the special capacitor is thermostatically controlled. Thus the temperature dependence of the dielectric constant can be determined, an example of which is given for dimethylformamide. The dielectric constant can be measured to 0.05% accuracy for $\xi = 1 - 3$ and 0.5% for ξ up to 100. The dipole moment can be computed by the Debye formula for dilute solutions or by the Onsager formula for pure liquids. As an example, the dipole moments of chlorobenzene and phenylhydra-

Card 2/3

ACCESSION NR: AP4033621

zone acetaldehyde (measured in benzene solutions at 25°C) were found to be 1.59 and 2.52 respectively. Orig. art. has: 2 equations, 1 diagram, and 2 tables.

TITLE: Oscillographic polarography with the use of step voltage

SOURCE: Zhurnal analiticheskoy khimii, v. 20, no. 10, 1965, 1048-1053

TOPIC TAGS: polarographic analysis, cathode polarization, oscillograph

ABSTRACT: Curves of the dependence of the diffusion current on the polarizing step voltage, i. e., theoretical forms of oscillopolarograms, were calculated with the Minsk-11 digital computer by using A. Sevik's formula for the dimensionless current

$$I_p = \frac{1}{2} \sqrt{\frac{E}{2\pi}} \sum_{k=1}^{p-1} \frac{1}{\sqrt{p-k} \operatorname{ch}^2[\beta(k-k_{11})]} ; p=1, 2, 3, \dots, m.$$

From the curves obtained, graphs of the dependence of the main parameters characterizing an oscillopolarogram on the magnitude of the step were plotted. The theo-

Card 1/2

L 14690-66

ACC NR: AP6005877

retical results were compared with actual oscillopolarograms of 10^{-3} M solutions of cadmium and thallium salts and found to be in good agreement. Qualitative fractional differentiation of the oscillopolarograms increased the resolving power (to 45 mV) and sensitivity ($5 \cdot 10^{-8}$ M) of the method of oscillographic polarography employed. TOPIC TAGS: polarograph, cathode follower, voltammetry, polarograph circuit,
polarograph power supply

TRANSLATION: A circuit is examined having a voltage transmission coefficient of almost 1 and an output impedance of a few ohms. The design and practical modification of such a circuit for use in supplying a variable-current polarograph are described. Electron tubes are used to provide an enhanced feedback in the circuit for the purpose of decreasing the internal resistance. An actual circuit for use with a 225-cycle square-wave voltage is shown. This design has many advantages over one having transformer-coupled feedback. The amplification factor of the feedback can be made much larger and it can be regulated; consequently the output

Card 1/2

ACCESSION NR: AR4014679

impedance can be made much smaller and controllable. There is no noticeable pulse distortion, and the circuit is smaller than others. Such circuits can be used to measure currents of a given alternating voltage passing through nonlinear single pairs. Orig. art. has: 7 figs. and 1 ref.

TITLE: Oscilloscopic equipment for measuring characteristics of electrochemical transducers

SOURCE: Kazan. Aviatsionnyy institut. Trudy, no. 82, 1964. Radiotekhnika i elektronika (Radio engineering and electronics), 27-33

TOPIC TAGS: electrochemical diode, polarography

ABSTRACT: These characteristics of electrochemical transducers used in polarographic work can be measured by the new equipment: (1) Static I-V charact.; (2) Transient characteristic; (3) Dynamic characteristic. A block diagram of the new outfit contains: a sawtooth, triangular, and square 0.001--100cps voltage generator with a pulse rise from 1 mv/sec to 100 v/sec; a compensator (a 2-stage balanced d-c amplifier); a calibrator with its changeover switch; an oscilloscope with its amplifiers; a photo attachment. The outfit permits segregation of diffusion and capacitive currents. Nine oscillograms illustrate the performance of the outfit. Orig. art. has: 7 figures.

PERIODICAL: Nauchnyye doklady vysstey shkoly. Khimiya i khimicheskaya tekhnologiya, 1958, Nr 4, pp 779-781 (USSR)

ABSTRACT: Experimental data were given on the influence exerted by ultrasonic vibrations on the gas content during the electrolysis of H_2SO_4 and $NaCl$ as well as $NaOH$ in order to obtain H_2O_2 and Cl_2 . The electrolysis indicated in table 1 was carried out by means of specially manufactured apparatus. The modification of the electrolyte resistance factor in dependence on the gas content at the ultrasonic field was investigated. The dependence of the gas content on time under influence exerted by ultrasonics on the electrolyte was investigated. A considerable reduction of the gas content percentage takes place in the ultrasonic field due to a decrease of the ohmic resistance during the analysis. In the course of a more extended electrolysis in the ultrasonic field the percentage of gas content

Card 1/2

SOV/156-58-4-43/49

The Influence Exerted by the Ultrasonic Field on the Gas Content During
the Electrolysis

becomes constant. In order to obtain hydrogen and chlorine by application of ultrasonics a decrease in electric power consumption takes place.

There are 4 figures and 10 references, 8 of which are Soviet.

TITLE: On the uniformity of metal distribution upon the cathode surface under electrolysis in an ultrasonic field

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 7, 1961, 21, abstract 70148 ("Tr. Kazansk. khim.-tekhnol. in-ta", 1960, no. 29, 67-68)

TEXT: The radioautograph method was used to investigate the character of metal distribution on the cathode and the uniformity of anode solution for Cu electrolysis while the electrolyzer was irradiated with ultrasound. The electrolyte contained 200 g/l $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ and 60 g/l H_2SO_4 . The electrolysis proceeded at a current density D of 30 ma/cm² and temperature of 30°C. The ultrasonic frequency was 21 KCps, power abt. 6 w/cm². The electrolytic Cu deposited on a cathode previously covered by a thin layer of radioactive Tl. After 20 min of electrolysis radioautographs were taken. Under the conditions indicated the ultrasonic field promotes the uniform distribution of metal on the cathode surface and the uniformity of anode solution. The frequency of the ultrasound affects the uniformity of the metal distribution.

Syphilis, Antibiotic Effects

"Influence of Certain Antibiotics on Spirochaeta pallida Culture," S. M. Vysoleva,
Chair of Microbiol, Kazan State Med Inst,
5 pp

"West Venerol i Dermatol" No 1.

Motility of Spirochaeta pallida is not always
an indication of its virulence. Effect of an
antibiotic should be based on its ability to
prevent further growth of the microorganism.

65/49757

USER/Medicine - Spirochaeta pallida Jan/Feb 49
(Contd)

Various types of spirochaeta have different re-
actions to antibiotic preparations. Weak
penicillin solutions have spirochetostatic action
while strong solutions have spirochetocidal
action. Types II and V (Kazan types) are most
resistant to penicillin. Gramicidin has in-
significant spirochetocidal action. Aspergillin
does not retard growth, and is effective only
against type B and IV spirochaeta.

Abstract : In short-time action the cessation of treponema motility
and the change in their morphology was caused only by
high concentrations of various penicillin preparations.
Partial immobilization occurred at a concentration of 5825
units of the amorphous, 12,725 units of crystalline peni-
cillin per ml. A weaker action was noted in an imported
crystalline penicillin. Although treponema lost motility,
they retained their viability. In long-time action the

Effect of various penicillin preparations on *Treponema pallidum*.
Report No.3: Effect of penicillin on tissue *Treponema*. Zhur.mikrobiol.
epid. i immun. 29 no.7:47-53 J1 '58 (MIRA 11:8)

1. Iz TSentral'nogo instituta usovershenstvovaniya vrachey, TSentral'nogo kozhno-venerologicheskogo instituta i Kazanskogo instituta usovershenstvovaniya vrachey imeni Lenina.

(TRIPONEMA PALLIDUM, effect of drugs on,
penicillin (Rus))

(PENICILLIN, effects,
on *Treponema pallidum* (Rus))

VYASELEVA, S.M.

Effect of various penicillin preparations on *Treponema pallidum*.
Report No.4: Effect of penicillin on *Treponema* in human syphilis
and dynamics of the penicillin content of blood and urine. Zhur.
mikrobiol. epid. i immun. 29 no.7:54 J1'58. (MIRA 11:8)

1. Iz TSentral'nogo instituta usovershenstvovaniya vrachey, TSentral'
nogo kozhnovenereologicheskogo instituta i Kazanskogo instituta
usovershenstvovaniya vrachey imeni Lenina.

(SYPHILIS, therapy,

penicillin, eff. on *Treponema* & blood & urine content
(Rus))

(PENICILLIN, ther. use.,

syphilis, eff. on *Treponema* & blood & urine content
(Rus))
